SUMMARY

Senior data analyst with 5+ years of experience in business reporting and analytics at FirstSource and Dunzo, starting as an intern at Dunzo in 2020. Builds Power BI dashboards and SQL reports used by 45+ people, and automates recurring work with Excel/VBA and Python. Has also built ETL jobs in SSIS, Alteryx and Azure Data Factory, led requirement sessions with business stakeholders, and reviewed the work of junior analysts. Checks every report against the source system before it is released.

EXPERIENCE

FirstSource — Hyderabad, India

Senior Data Analyst — *October 2024 – August 2026*

Owned 12 Power BI dashboards and the SQL reports behind them for the sales and finance teams, used by about 45 stakeholders in weekly and monthly business reviews. Covered the work from requirements through deployment and support.

Wrote SQL (CTEs, window functions, multi-table joins, stored procedures) on SQL Server to extract and validate data, and reconciled totals with the source system before every release.

Built a Python (pandas) script that cleans, merges and validates 15 files from 4 sources and writes the result to a reporting table, replacing a manual process that took about 6 hours each week.

Wrote Python data quality checks for row counts, nulls, duplicates and key mismatches that ran after each load and emailed the team when a test failed.

Automated the weekly sales performance report with Excel VBA and SQL, cutting refresh time from 5 hours to 20 minutes.

Designed the Power BI data model with Power Query and DAX so revenue and gross margin were defined once and matched across every report.

Built ETL jobs in SSIS, Alteryx and Azure Data Factory to load sales and finance data into reporting tables, and traced failed loads back to their root cause.

Led requirement sessions with finance and operations stakeholders, turned them into data mapping and metric definition documents, and got the logic signed off before development started.

Reviewed reports and queries from 3 junior analysts and kept team conventions for naming, metric definitions and documentation.

Worked in Scrum sprints, resolved production issues and handled about 25 ad-hoc data requests a month.

Dunzo — Bengaluru, India

Data Analyst — *September 2020 – June 2024*

Started as a data analyst intern (September 2020 – March 2021), supporting the analytics team with Excel data cleaning, basic SQL queries and daily reports, then joined the company as a Data Analyst.

Analyzed regional sales data in SQL, Excel and Power BI; found that 18% of discounts in two regions were applied outside policy, which led the team to tighten approval rules.

Produced the weekly management report from different data sources, applying business rules and validation checks before it went to the regional heads and the finance director.

Used Python (pandas, matplotlib) to analyze customer churn data too large for Excel (about 2 million rows) and presented the results to the commercial team.

Cleaned and reconciled datasets so numbers in the reports matched the source systems.

Built Excel tools with PivotTables, Power Query and VBA that 20 people used every week in place of manual copy-paste.

Handled ad-hoc SQL requests from the sales, finance and operations teams, typically within one business day.

Traced report discrepancies through the source, staging and reporting layers and worked with developers to fix the root cause.

Wrote up report logic, data sources and metric definitions so others could maintain them.

SELECTED PROJECTS

Executive KPI Dashboard *FirstSource | Power BI, DAX, SQL*

Consolidated 6 sources into one Power BI dashboard tracking 18 KPIs for the leadership team, replacing 9 separate Excel reports.

Agreed KPI definitions with the sales and finance heads and documented them, ending recurring disputes over which number was correct.

Tuned the data model and DAX measures, bringing page load time from 14 seconds to 4 seconds.

Automated Data Quality and Reconciliation Framework *Dunzo | SQL, Python, Excel*

Built SQL and Python checks comparing source and reporting tables on row counts, totals, duplicates and missing keys.

Produced a daily exception report for the data owners, which cut mismatched records between source and reports by 70% in 3 months.

Advanced Excel Reporting Automation *Dunzo | Excel, VBA, PivotTables*

Built a reporting workbook with Excel, PivotTables and lookup formulas that combined 5 weekly data extracts, replacing about 4 hours of manual copy-paste each week.

Wrote VBA macros that refresh the data, run validation checks and export the report for the regional heads, used by 20 people every week.

TECHNICAL SKILLS

SQL & Analysis	Advanced SQL (joins, CTEs, subqueries, window functions, stored procedures), data validation, reconciliation, root cause analysis
BI & Reporting	Power BI, DAX, Power Query, Tableau
Excel	Advanced formulas, lookup functions, PivotTables, Power Query, VBA macros, reporting automation
Python	pandas, NumPy, matplotlib, openpyxl, SQLAlchemy; data cleaning, validation checks, report automation
ETL Tools	SSIS, Alteryx, Azure Data Factory
Cloud & Tools	Azure, AWS, Git
Ways of Working	Agile/Scrum, requirements gathering, stakeholder reporting, mentoring

EDUCATION

Osmania University Hyderabad, India

B.sc Computer Science *2021*
